when you do things, they may have an effect on your situation. The author asks the reader to be attentive and to make certain that she is a parasitologist and not the owner of a few worms. *Biblica gráfica de la vida adulta de los zoofígnos* It does not hurt people to eat plants. *Biblica gráfica de la vida adulta de los zoofígnos* All parasites are organisms that live on or inside a host. The parasitologist examines the contents of the parasite. The parasitologist studies the organisms of interest to determine their life cycle, life form, tissue and environment. The clinical parasitologist is concerned with the etiology of the disease as well as how it is transmitted from the host to the intermediate or paratenic host. Parasites are classified as endoparasites and ectoparasites. Ectoparasites are the organisms that live on or within the surface of a host. The types of ectoparasites that infect humans are arthropods, namely fleas, ticks, lice, mites, flies, and mosquitoes. Most parasites that invade humans can be found in either the tropics or the subtropics. Those that can be found in the tropics include hookworms, tapeworms, and the pinworms that live in the human intestine. The causes of the development of diseases due to parasites are identified when a parasite, an intermediate host, and a final host are shown to infect a host. Viral pathogens, bacterial pathogens, fungal pathogens, and protozoan pathogens are shown to infect and develop in the host. Chemical weapons are applied against living organisms such as humans, animals, or plants. When these weapons are applied to humans, they are called chemical weapons. Parasites that are used as weapons are more commonly known as biological weapons. Biological weapons are usually toxins or bacteria that are harmful to humans, animals, or plants. The word parasitism is taken from the Greek, meaning to live on or within a living host. The host may be a host cell or an individual. Parasitism occurs when a parasite derives benefit from its host. Parasitism that does not involve a host cell is called commensalism. Parasitism that involves a host cell is called parasitism. Although some parasites cause disease, they are usually not
